Supplemental table 2. Proportion of children scoring $\leq 15^{\text {th }}$ and $\leq 5^{\text {th }}$ percentile on motor assessment using the MABC-2 at 6-8 and 10-12 years of age among children who completed assessments on both occasions. Comparison to norms using a binomial test. McNemar test revealed no significant difference between the two assessment occasions neither for the proportion of children scoring $\leq 15^{\text {th }}$ percentile ( $p=0.791$ ), nor for the proportion of children scoring $\leq 5^{\text {th }}$ percentile ( $p=0.549$ ).
Abbreviations: MABC-2; Movement assessment battery for children, $2^{\text {nd }}$ edition; perc, percentile, CI, Confidence interval.

| Motor Assements | $\leq \mathbf{1 5}^{\text {th }}$ perc | $\mathbf{\%}$ | $\mathbf{9 5 \%}$ <br> $\mathbf{C I}$ | p-value | $\leq \mathbf{5}^{\text {th }}$ <br> perc | $\mathbf{\%}$ | $\mathbf{9 5 \%}$ CI | p-value |
