Conclusion Our findings show that monochorionicity and nulliparity are associated with adverse perinatal outcomes in twin pregnancies, and confirm that these pregnancies warrant close antenatal surveillance.

NATIONAL REVIEW OF POSTMORTEM RATES IN IRELAND – ARE WE TO BLAME?

doi:10.1136/archdischild-2013-303966.330

One in 200 babies in the Republic of Ireland is stillborn. Investigating the cause of stillbirth helps give the clinician valuable information in relation to managing a subsequent pregnancy. A PM is the most useful and informative investigation that can be performed in the postnatal period.

PM uptake rates in Ireland are low, circa 50%. There are few guidelines for staff on how to broach this issue and it is possible that individual clinicians’ attitudes to PM affect the uptake rates.

We conducted a questionnaire study examining the attitudes of midwives and obstetricians in Ireland to perinatal PM. This questionnaire has been validated by the ISA, ANZSA and also by UK – Sands.

In total 117 questionnaires were completed. Obstetricians made up 44% of respondents - the rest were midwives. 17% of respondents never gave information to parents about PMs. Of those who did, only 37% did so at the time of diagnosis. The majority of respondents (76%) were dissatisfied with the quality of training received in how to counsel for PM. 46% of respondents were satisfied with the quality of information materials available in counselling parents re PM. 83% felt that a clinical guideline would be helpful to assist parents in decision making.

To summarise, there is a wide variation among health care staff in the current knowledge and clinical practice relating to stillbirth and consenting for PM. We anticipate that by introducing a standardised guideline and improving staff education that our PM rates will improve dramatically.

DOMESTIC VIOLENCE AND TERMINATION OF PREGNANCY: A SYSTEMATIC REVIEW OF THE LITERATURE

doi:10.1136/archdischild-2013-303966.331

Introduction Domestic violence (DV) during pregnancy is common and correlated with maternal and perinatal morbidity and mortality, but less is known about the association with termination of pregnancy (TOP). The aim of this research was to synthesise current evidence on the association between DV and TOP.

Methods A systematic review was undertaken, with a structured search of four databases and reference list screening. Screening of titles and abstracts (241 papers excluding duplicates) was carried by two authors and selected papers were read in full (71). Inclusion criteria were peer-reviewed publication with defined methodology studying TOP and an aspect of DV. Formal data extraction and CASP scoring of 50 quantitative and 4 qualitative studies was undertaken by two authors. PRISMA guidelines were followed.

Results 91% of studies from 19 countries found a correlation between TOP and DV, relating to physical, emotional and sexual violence. Reported prevalence of DV varied from 7–29% (recent) and 21–39.5% (lifetime). Rates were higher amongst women who did not tell their partners about the TOP. There was a consistent correlation with DV and multiple terminations. The reasons that women in violent relationships chose to terminate was examined: two studies found women who were pressurised or forced by their partner into TOP. Descriptions of contraceptive sabotage and rape-related pregnancy were also identified. Five studies using male subjects found similar results.

Conclusion DV is common among women seeking TOP. Their healthcare and safety needs differ from the general population and should be considered by care providers.

ABNORMAL PLACENTAL PATHOLOGY AND SHORT-TERM NEONATAL OUTCOMES IN THE PRETERM INFANT

doi:10.1136/archdischild-2013-303966.333

Introduction Placental pathology provides a unique insight into the intrauterine environment prior to preterm birth. Although other confounding variables were not controlled for in this study, the evidence would suggest a policy of screening for ASB remains a reasonable option in pregnancy. (supported by Cerebra).

Keywords Asymptomatic bacteriuria/pyelonephritis/preterm labour/low birth-weight.
