

Supplemental table 2. Proportion of children scoring $\leq 15^{\text{th}}$ and $\leq 5^{\text{th}}$ percentile on motor assessment using the MABC-2 at 6-8 and 10-12 years of age among children who completed assessments on both occasions. Comparison to norms using a binomial test. McNemar test revealed no significant difference between the two assessment occasions neither for the proportion of children scoring $\leq 15^{\text{th}}$ percentile ($p=0.791$), nor for the proportion of children scoring $\leq 5^{\text{th}}$ percentile ($p=0.549$). Abbreviations: MABC-2; Movement assessment battery for children, 2nd edition; perc, percentile, CI, Confidence interval.

Motor Assements	$\leq 15^{\text{th}}$ perc	%	95% CI	p-value	$\leq 5^{\text{th}}$ perc	%	95% CI	p-value
MABC-2 at 6-8 years of age (n)	11/44	25	13-40	0.050	7/44	16	7-30	0.001
MABC-2 at 10-12 years of age (n)	13/44	30	17-45	0.006	10/44	23	11-38	<0.001
